

Stevenson Farms, Selden, Kansas

We installed your structured water unit on one of our pivots for the 2016 season. We planted irrigated corn on this pivot and saw an increase of 15 bushels of corn for each acre which equated out to our best whole field average since 2009. This pivot usually gets stuck in the mud several times during the season, but did not get stuck with the water unit installed because the water never pooled but penetrated straight down into the ground. Also, our corn yield was very even thru out the field.

Dick Stevenson,
